

|                                                                                                           |
|-----------------------------------------------------------------------------------------------------------|
| POLICY LENS: Isaac AI Capabilities vs. GC/HC Policy<br>(Added to Enterprise_AI_Capability_Framework.xlsx) |
|-----------------------------------------------------------------------------------------------------------|

NEW SHEET: "Policy & Governance Alignment"

Maps 16 Isaac AI Capabilities (8 original + 7 gaps + 1 management) to:

1. DADM DIRECTIVE ON AUTOMATED DECISION-MAKING (TBS 2021, updated 2023)
2. 12 GC GUIDING PRINCIPLES FOR AI ([canada.ca/responsible-use-ai](https://canada.ca/responsible-use-ai))
3. HC AI STRATEGY (DTBCC) – Focus areas + Enabling pillars
4. GOVERNANCE GATES & GATEKEEPING REQUIREMENTS

PART 1: DADM DIRECTIVE REQUIREMENTS (\$-level mapping)

The DADM requires three tiers of compliance:

|                                                              |
|--------------------------------------------------------------|
| TIER 1: DATA INTEGRITY (§2.2) – Applies to ALL AI using data |
|--------------------------------------------------------------|

|               |
|---------------|
| Requirements: |
|---------------|

- |                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>• Lawful collection, use, and disclosure of training/input data</li><li>• Bias testing in training data (esp. Protected B health data)</li><li>• Data minimization (use only necessary features)</li><li>• Privacy-preserving processing (federated learning, differential privacy)</li></ul> |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                     |
|-------------------------------------|
| Isaac capabilities triggering §2.2: |
|-------------------------------------|

- |                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>✓ Knowledge AI (RAG) – data lineage, lawfulness</li><li>✓ Predictive AI – bias in historical data</li><li>✓ Perception AI (both) – lawful collection from documents/images</li><li>✓ Data Privacy &amp; Isolation (AI-specific) – CORE compliance capability</li><li>✓ Bias &amp; Fairness Testing (AI-specific) – CORE compliance capability</li></ul> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------|
| TIER 2: DECISION GOVERNANCE (§3.1–§3.3) – Applies to AI in automated decisions affecting citizens, programs, or regulatory outcomes |
|-------------------------------------------------------------------------------------------------------------------------------------|

|                                                                 |
|-----------------------------------------------------------------|
| §3.1 CORE: Mandatory explanation, appeal mechanism, audit trail |
|-----------------------------------------------------------------|

| §3.2: Explanation of decision reasoning (citizen right) |

| §3.3: Impact assessment (ongoing monitoring & fairness) |

| Isaac capabilities triggering §3.1-3.3: |

- | ✓ Generative AI – explanation of generated content (for regulated output) |
- | ✓ Classification AI – triage decision explanation (regulatory intake) |
- | ✓ Conversational AI – disclosure of AI involvement (citizen-facing) |
- | ✓ Orchestration AI – workflow decision explanation & override capability |
- | ✓ Decision Support AI (AI-specific) – CORE compliance capability |
- | ✓ Explainability & Interpretability (AI-specific) – CORE compliance |
- | ✓ Real-time & Streaming AI – escalation workflows, timely explanation |

| TIER 3: SYSTEM CONTROLS (§5) – AI-specific governance, change control,  
| security testing, integration architecture |

| Requirements: |

- | • Model versioning, testing, rollback procedures |
- | • Change control for AI updates |
- | • Documented integration interfaces & SLAs |
- | • Adversarial attack testing & security validation |
- | • Audit trail architecture (logging, traceability) |

| Isaac capabilities triggering §5: |

- | ✓ AI Model Management & Registry (AI-specific) – §5 change control CORE |
- | ✓ Enterprise AI Integration (AI-specific) – §5 interface documentation |
- | ✓ Adversarial Robustness & Security (AI-specific) – §5 security testing |
- | ✓ Orchestration AI – rollback SLA, circuit breakers |

---

## PART 2: GC GUIDING PRINCIPLES (12 principles from canada.ca)

---

1. Openness – Transparent about how, why, when AI is used
2. Individual/Community Needs – Prioritize citizen needs, equity
3. Early Risk Assessment – Assess & mitigate risks early in lifecycle
4. Privacy & Data Rights – Lawful collection, disclosure, respect IP
5. Bias & Accuracy – Minimize biases, evaluate outputs
6. Transparency Documentation – Publish impact assessments, source code, audits
7. Explanation & Appeal – Explain decisions, enable appeal/contest, human review
8. Responsible Research – Test environments for controlled innovation
9. Oversight Mechanisms – Ensure accountability & monitoring throughout
10. Environmental Impact – Zero-emission AI systems where appropriate
11. Civil Service Training – Train staff on legal, ethical, privacy, security

issues

12. Public Engagement – Inclusive engagement, raise awareness, build trust

Capabilities mapped to principles (see "GC AI Principles" column in sheet).

---

PART 3: HC AI STRATEGY ALIGNMENT (DTBCC framework)

---

THREE FOCUS AREAS:

- A. Empower the Workforce – Task automation, copilots, knowledge support
- B. Scale & Strengthen Surveillance – Real-time health signal detection
- C. Enhance Regulatory Processes & Services – Intake modernization, submission support

FOUR ENABLING PILLARS:

- 1. People & Data Talent – Capability development, workforce readiness
- 2. Policy Infrastructure – Policy harmonization, governance frameworks
- 3. Data & Technology – Enterprise platforms, reusable capabilities
- 4. Governance & Risk – Oversight, compliance, trustworthiness

Capability alignment shown in "HC AI Strategy Alignment" column:

Example: "Generative AI → Empower the Workforce (copilots) | Policy Infrastructure (governance)"

---

PART 4: GOVERNANCE GATES & GATEKEEPING (ARB/Enterprise controls)

---

Each Isaac capability has explicit governance gates. Examples:

|                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------------------|
| Generative AI                                                                                                                      |
| Gate: Algorithmic Impact Assessment (AIA) + Peer review for high-risk cases<br>(Triggers: DADM §3.2 explanation requirement)       |
| Decision Support AI                                                                                                                |
| Gate: AIA MANDATORY + Audit trail architecture + Appeal/override procedure<br>(Triggers: DADM §3.1 CORE requirement for decisions) |
| Explainability & Interpretability                                                                                                  |
| Gate: Explainability testing (LIME/SHAP) + Citizen disclosure<br>(Triggers: DADM §3.2 CORE citizen right to explanation)           |
| Bias & Fairness Testing                                                                                                            |

|                                                                                                                                                        |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Gate: Mandatory demographic parity analysis + Protected population impact<br>(Triggers: DADM §2.2 CORE bias requirement)                               |
| Real-time & Streaming AI<br>Gate: Sub-100ms audit write validation + Human review SLA (<5 min)<br>(Triggers: DADM §3.1 timely explanation requirement) |

---

## CRITICAL INSIGHTS FOR ARB SUBMISSION

---

1. DADM-CORE REQUIREMENTS (Non-negotiable for any AI touching decisions or data):
  - ✓ §2.2: Bias testing, data minimization, privacy-preserving processing
  - ✓ §3.1: Explanation, appeal mechanism, audit trail (if decision-touching)
  - ✓ §3.2: Citizen right to explanation (if citizen-facing decision)
  - ✓ §5: Change control, integration documentation, security testing

2. MISSING CAPABILITIES THAT DADM SIGNALS:

- Explainability & Interpretability (Gap 1.2) – MUST be added (DADM §3.2)
- Bias & Fairness Testing (Gap 1.3) – MUST be added (DADM §2.2)
- AI Model Management (Gap 1.1) – MUST be added (DADM §5)

Without these, DADM compliance is impossible.

3. GC PRINCIPLES ALIGNMENT:

All 16 Isaac capabilities now map to at least 3-4 GC principles.

No capability stands alone; all require multi-principle orchestration.

4. HC AI STRATEGY MAPPING:

- Surveillance cluster capabilities → Scale & Strengthen Surveillance (Real-time AI, Predictive AI)
- Regulatory cluster capabilities → Enhance Regulatory Processes (Classification, Decision Support, Explainability)
- Workforce capabilities → Empower the Workforce (Generative AI, Conversational AI, Orchestration)

5. POLICY LENS IMPLICATION FOR ISAAC v2.4:

The framework must include:

- ✓ All 16 capabilities (8 + 7 gaps + management)
- ✓ Explicit DADM requirement mapping (§ references)
- ✓ GC Principle cross-references
- ✓ HC AI Strategy alignment
- ✓ Governance gates per capability

This is your ARB-defensible proof that Isaac aligns to GC policy signals.

---

## EXPECTED ARB QUESTIONS & YOUR ANSWERS

---

Q: "How does this framework ensure DADM compliance?"

A: Every capability in our policy alignment sheet maps to specific DADM § requirements.

Core capabilities (Explainability, Bias Testing, Model Management) directly satisfy

§2.2, §3.1-3.3, and §5. Governance gates at each capability ensure controls are implemented before deployment.

Q: "Which capabilities are mandatory for PATH/HAIL v1?"

A: DADM-core capabilities are mandatory for ANY AI touching decisions or protected data:

- Explainability & Interpretability
- Bias & Fairness Testing
- AI Model Management & Registry
- Enterprise AI Integration

All others scale per use case risk tier.

Q: "How does this align to HC AI Strategy?"

A: Every capability maps to at least one focus area (Workforce, Surveillance, Regulatory)

and at least two pillars (People, Policy, Technology, Governance). The alignment

demonstrates that our enterprise AI capabilities support HC's strategic mandates.

Q: "Is this consistent with GC AI Principles?"

A: Yes. All 16 capabilities map to the 12 GC guiding principles. No capability violates

any principle. Many capabilities satisfy multiple principles simultaneously (e.g., Generative AI satisfies principles 1, 5, 7, 9).

---

## USAGE IN ARB SUBMISSION

---

Reference this sheet when:

- Defending Isaac capability selection against TBS/PSPC/SSC challenges
- Showing DADM compliance architecture
- Demonstrating HC AI Strategy alignment
- Proposing governance gates for each capability

- Explaining why certain capabilities are CORE (non-optional)
- Showing that enterprise AI platform design is policy-driven, not tool-driven
